SCHMIDT® SIGMAWIG
ALL WELDED PLATE
HEAT EXCHANGERS
SIGMA plate heat exchangers are recognized world-wide for quality and reliability in thermal processes such as cooling, heating, pasteurising, evaporation and condensation. To meet the increasing requirements for plate heat exchangers in special applications, a new type of plate heat exchangers without gaskets called SIGMAWIG was developed particularly for:

- Chemical industry
- Pharmaceutical industry
- Industrial cooling
- Heat balancing systems

The SIGMAWIG construction makes it possible to noticeably extend the application of plate heat exchangers in respect of new media, temperatures and operating pressures. Especially media with aggressive or environmentally dangerous potential can be controlled with this new gasket-free plate heat exchanger design.

TIG welding seams without filler eliminate the risks of leakage and diffusion. That is why more and more SIGMAWIG are used, where operational dependability is indispensable:

- Control of chemical reaction processes
- Temperature equalization of intermediate and final products
- Cooling, heating or condensation of solvents
- Cooling and heating of DEMI-water
- Heat recovery in chemical or refining processes
- Evaporation / condensation of refrigerants

SIGMAWIG in standard design can be applied for operating pressures of up to 25 bar and operating temperatures of up to 250 °C.

Special design for higher pressures and temperatures and in special alloys are available.
SIGMAWIG – one application out of a vast multitude

More than 10,000 SIGMAWIG prove under tough process conditions

SIGMAWIG – main connection types

**STANDARD FLANGED CONNECTION**
Availability of a variety of flanges—ranging from standards such as EN 1092 to ASME 16.5 as well as a number of other standards upon request.

**FLANGED CONNECTION WITH INTERNAL EXPANSION JOINTS**
A construction for applications with frequent temperature changes that is proven in more than 1,000 installations.

**STUDDED PORT WITH O-RING SEALING BETWEEN PLATE PACK AND PRESSURE FRAME**
The advantages of this connection type are not only in its cost efficiency but also in the possibility to change or extend the plate pack on site. Especially where nonstandard plate materials are required, this construction offers an economical solution while allowing higher nozzle loads and higher temperature changes.
### SIGMAWIG – the optimal choice for critical process parameters

SIGMAWIG – the all welded plate heat exchanger

Technical details

SIGMAWIG all welded plate heat exchangers are similar to gasketed plate heat exchangers because of the number of corrugated plates and do not include gaskets. The plates are sealed hermetically by TIG welded seams. The loading capacity of these connection exceeds the strength of gaskets.

The fishbone geometry of the flow channels built by the plates effects high turbulences on the fluids, which result in optimum heat transfer. The countercurrent flow arrangement allows most efficient heat transfer.

The welded plate pack is clamped into a pressure frame. Standard connections are flanges and threads.

For the standard product line, all parts in contact with the product are made of stainless steel and free of nonferrous metal.

Special alloys are possible, too.

A world of heat transfer solutions

API Heat Transfer’s global presence includes manufacturing facilities, R&D locations, and sales support throughout the world, all focused on one goal—to better serve our customers.

For more information about our heat transfer products, contact our API Heat Transfer sales representative or visit apiheattransfer.com or apiheattransfer.de

GLOBAL HEADQUARTERS
2777 Walden Avenue  |  Buffalo, NY 14225 USA  |  +1.716.684.6700  |  sales@apiheattransfer.com
