

# Fluid Cooling Industrial AOF Series

## Performance Notes

- AO with removable filter
- Adjustable louvers (manual)
- Medium flow rates
- Moderate heat removal
- One or two pass option

**OPTIONS**  
 Internal SAE straight threads  
 SAE & metric connections  
 Internal pressure bypass  
 Corrosive resistant marine coating

## Ratings

### Maximum Operating Pressure

300 PSI

### Test Pressure

300 PSI

### Maximum Operating Temperature

400°F

## Materials

**Tubes** Copper

**Fins** Aluminum

**Turbulators** Steel

**Fan Blade** Aluminum with steel hub

**Fan Guard** Zinc plated steel

**Cabinet** Steel with powder coat finish

**Manifolds** Steel

**Connections** Steel

## Net Weight (LBS)

Model	Weight
AOF-5	60
AOF-10	70
AOF-15	80
AOF-20	95
AOF-25	125
AOF-30	140
AOF-35	165
AOF-40	230

## Piping Diagram

### One Pass with Bypass

### Two Pass with Bypass

NOTE: All dimensions in inches.

## Piping Diagram Without Bypass

### One Pass

### Two Pass

\*See dimension chart for NPT or optional internal SAE connection size.

## Fan Rotation Clockwise/Facing Motor Shaft

NOTE: MOTOR MOUNTING BRACKET ON AO-5 & AO-10 IS ROTATED 90°

## Lubrication Notes

**Caution:** Do not over oil or over grease. **Ball bearings** – No grease needed at start up. Grease as follows:

5,000 Hours/Year	5 Year Grease Interval
Continuous — Normal Applications	2 Years
Seasonal Service — Motor is idle for 6 months or more	1 Year
Continuous — High ambients, dirty or moist locations, high vibration	6 Months

# Performance Curves

## One Pass Oil

## Two Pass Oil

## Oil Pressure Correction

# Selection Procedure

Performance Curves are based on 50SSU oil leaving the cooler 40°F higher than the ambient air temperature used for cooling. This is also referred to as a 40°F approach temperature.

**STEP 1 Determine the Heat Load.** This will vary with different systems, but typically coolers are sized to remove 25 to 50% of the input nameplate horsepower.

(Example: 100 HP Power Unit x .33 = 33 HP Heat load.)

$$\text{If BTU/HR is known: } \text{HP} = \frac{\text{BTU/HR}}{2545}$$

**STEP 2 Determine Approach Temperature.** Desired oil leaving cooler °F – Ambient air temp. °F = Actual Approach

**STEP 3 Determine Curve Horsepower Heat Load.** Enter the information from above:

$$\text{Horsepower heat load} \times \frac{40 \times \text{Cv}}{\text{Actual Approach}} = \text{Curve Horsepower}$$

**STEP 4 Enter curves** at oil flow through cooler and curve horsepower. Any curve above the intersecting point will work.

**STEP 5 Determine Oil Pressure Drop from Curves:**

● = 5 PSI   ■ = 10 PSI   ▲ = 15 PSI   + = 20 PSI

Multiply pressure drop from curve by correction factor found in oil ΔP correction curve.

## Desired Reservoir Temperature

**Return Line Cooling:** Desired temperature is the oil temperature leaving the cooler. This will be the same temperature that will be found in the reservoir.

**Off-Line Recirculation Cooling Loop:** Desired temperature is the oil temperature entering the cooler. In this case, the oil temperature change must be determined so that the actual oil leaving temperature can be found. Calculate the oil temperature change (oil Δ T) with this formula:

$$\text{Oil } \Delta T = (\text{BTU's/HR}) / (\text{GPM Oil Flow} \times 210)$$

To calculate the oil leaving temperature from the cooler, use this formula:

$$\text{Oil Leaving Temp.} = \text{Oil Entering Temp.} - \text{Oil } \Delta T$$

This formula may also be used in any application where the only temperature available is the entering oil temperature.

**Oil Pressure Drop:** Most systems can tolerate a pressure drop through the heat exchanger of 20 to 30 PSI. Excessive pressure drop should be avoided. Care should be taken to limit pressure drop to 5 PSI or less for case drain applications where high back pressure may damage the pump shaft seals.

## Oil Temperature

Typical operating temperature ranges are:

Hydraulic Motor Oil	110° - 130°F
Hydrostatic Drive Oil	130° - 180°F
Bearing Lube Oil	120° - 160°F
Lube Oil Circuits	110° - 130°F
